PRODUCT DESIGN CASE STUDY

NINO

Managing container rentals in one place

A web app for a business that rents construction waste containers.

Agostina Boris · Product concept, UX/UI design and prototype

01 · BUSINESS CONTEXT

A small team with a shared daily workload

NINO rents construction waste containers. The office team coordinates deliveries and pickups with the drivers throughout the day.

2	2	2	14
Office administrators	**Drivers**	**Trucks**	**Containers**

Today: customer details in a spreadsheet, daily jobs on paper and then in a planner, and each driver's route sent by WhatsApp.

02 · CURRENT WORKFLOW

The same information, recorded more than once

01

Paper notes

The day's deliveries and pickups are written down.

02

Daily planner

The notes are copied into the schedule.

03

WhatsApp

Each driver gets their route by message.

⚠ **The risk:** everything depends on each update being written down and passed on. One missed entry leaves a colleague without what they need.

03 · DESIGN GOALS

Less repeated work, a clearer daily schedule

A shared workspace for the two administrators, built around the tasks they already do every day.

01

Record each job once

A rental fills in the delivery and pickup schedule, with no copying.

02

Make pending work visible

Missing assignments, pickups and balances show where they matter.

03

Keep familiar routines

Drivers keep getting routes on WhatsApp, prepared in NINO.

04 · INFORMATION ARCHITECTURE

Navigation mirrors the daily operation

Home
What needs attention today

Rentals
Create and follow each rental

Containers
Units and availability

Logistics
Deliveries, pickups, trucks

Payments
Balances and payments

Permits
Municipal permits, deadlines

Settings
Company, users, rates

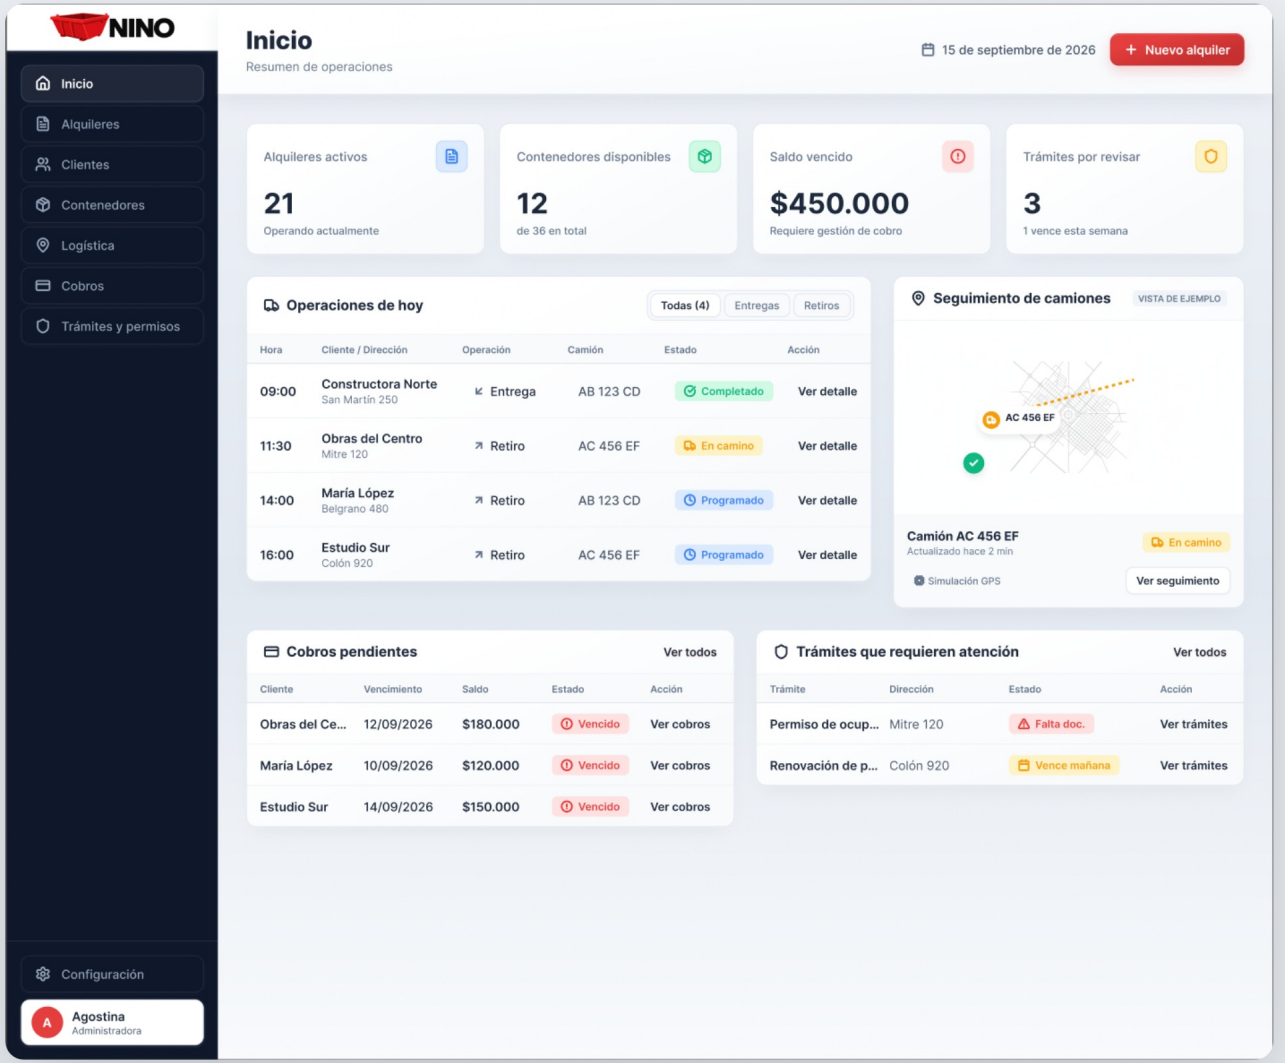

One new rental → Delivery scheduled in Logistics → Balance tracked in Payments

HOME

Start the day with what needs attention

- Today's deliveries and pickups, with truck and status.
- Overdue balances and permits that need action, right below.
- One main action: a new rental.

Goal 02 · Make pending work visible

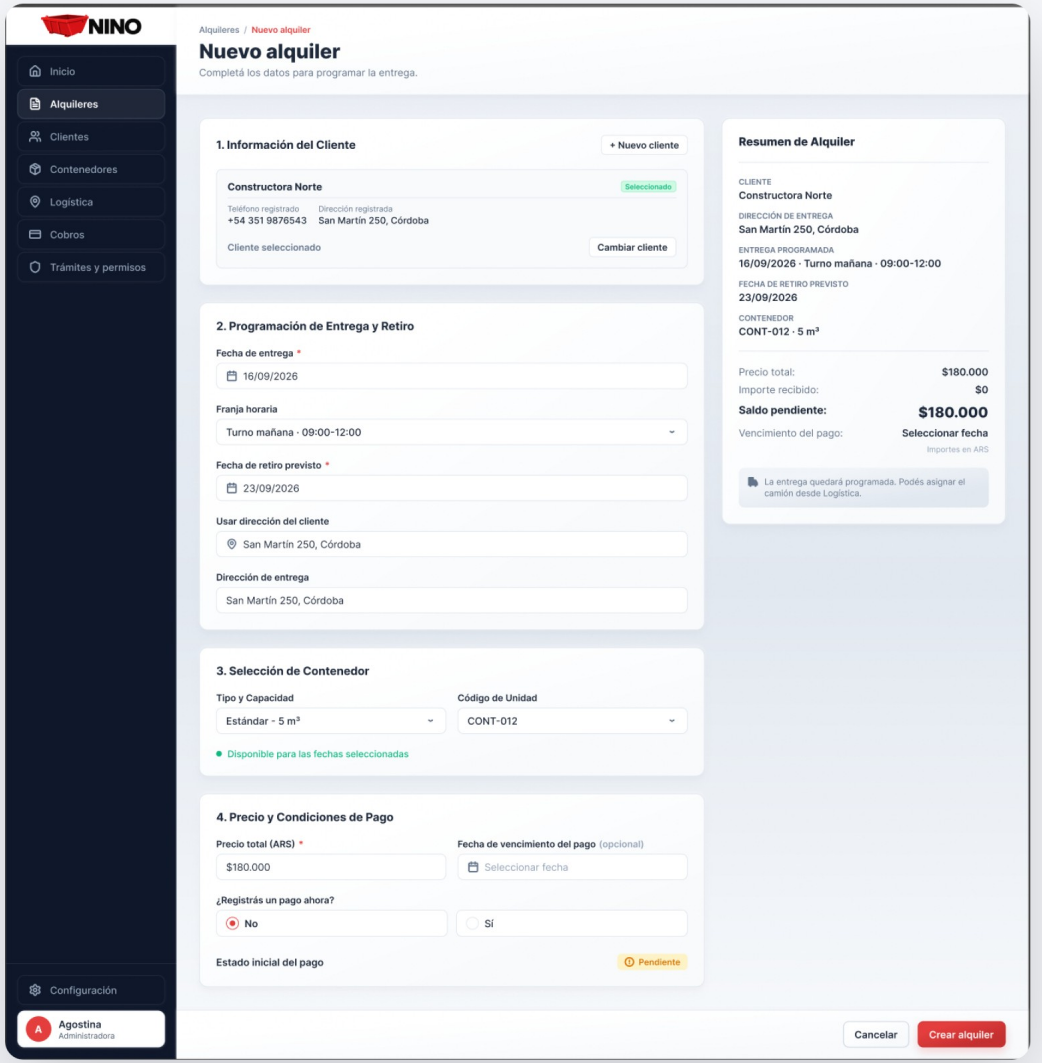

DECISION 1 · NEW RENTAL

One form that schedules the whole job

- Pick a saved client and their phone and address fill in.
- The container is checked against the chosen dates.
- A live summary shows dates, price and balance before saving.
- Saving schedules the delivery in Logistics, with no second entry.

Goal 01 · Record each job once

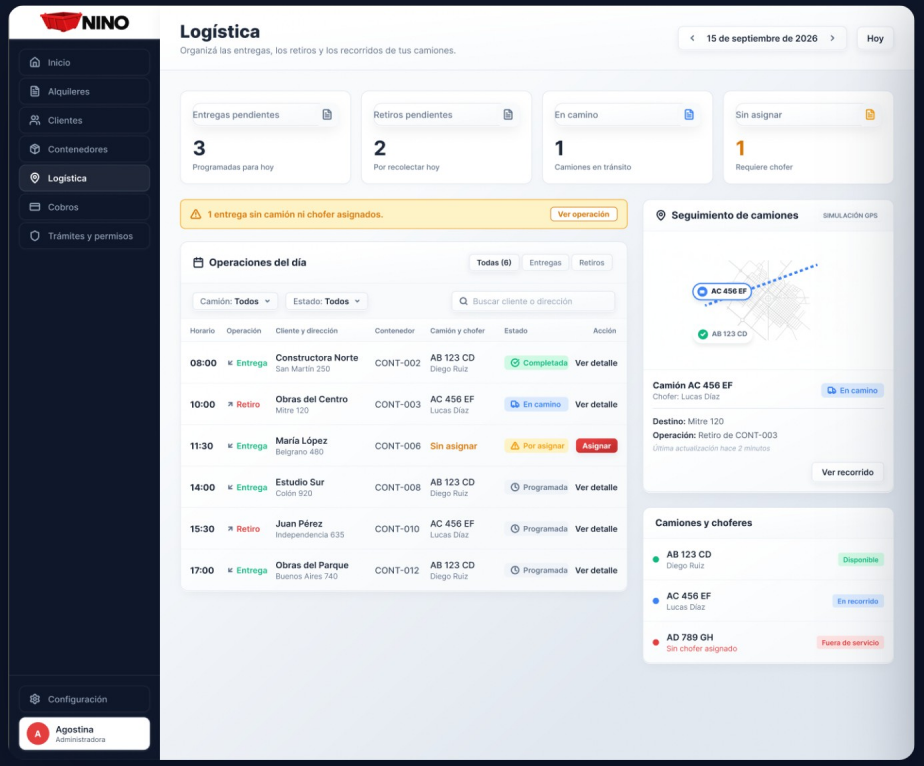

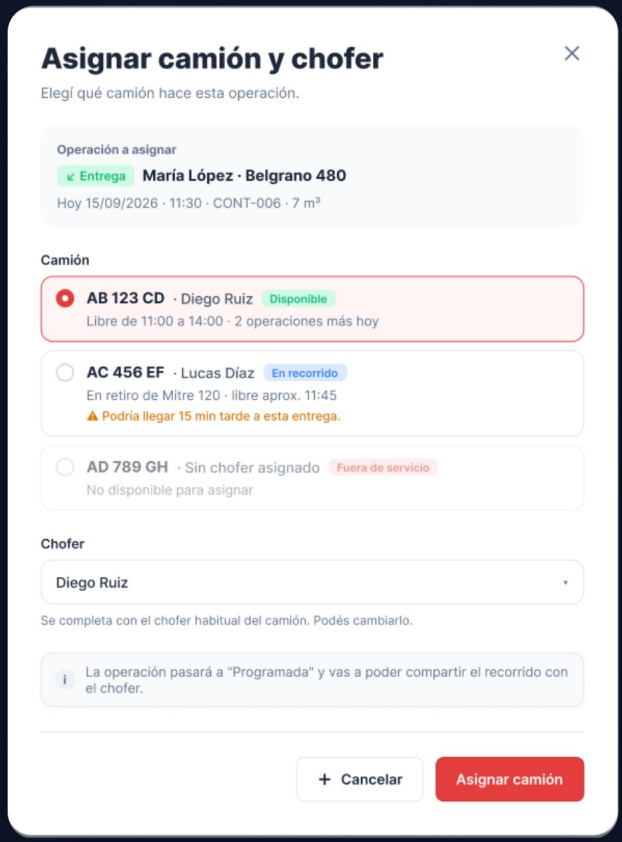

DECISION 2 · LOGISTICS

No job goes out without a truck

- A banner flags any delivery with no truck or driver.
- Assigning shows who's free, and warns when a truck could arrive late.
- The usual driver fills in, and the route can be shared with them.

Goals 02 and 03

DECISION 3 · PAYMENTS

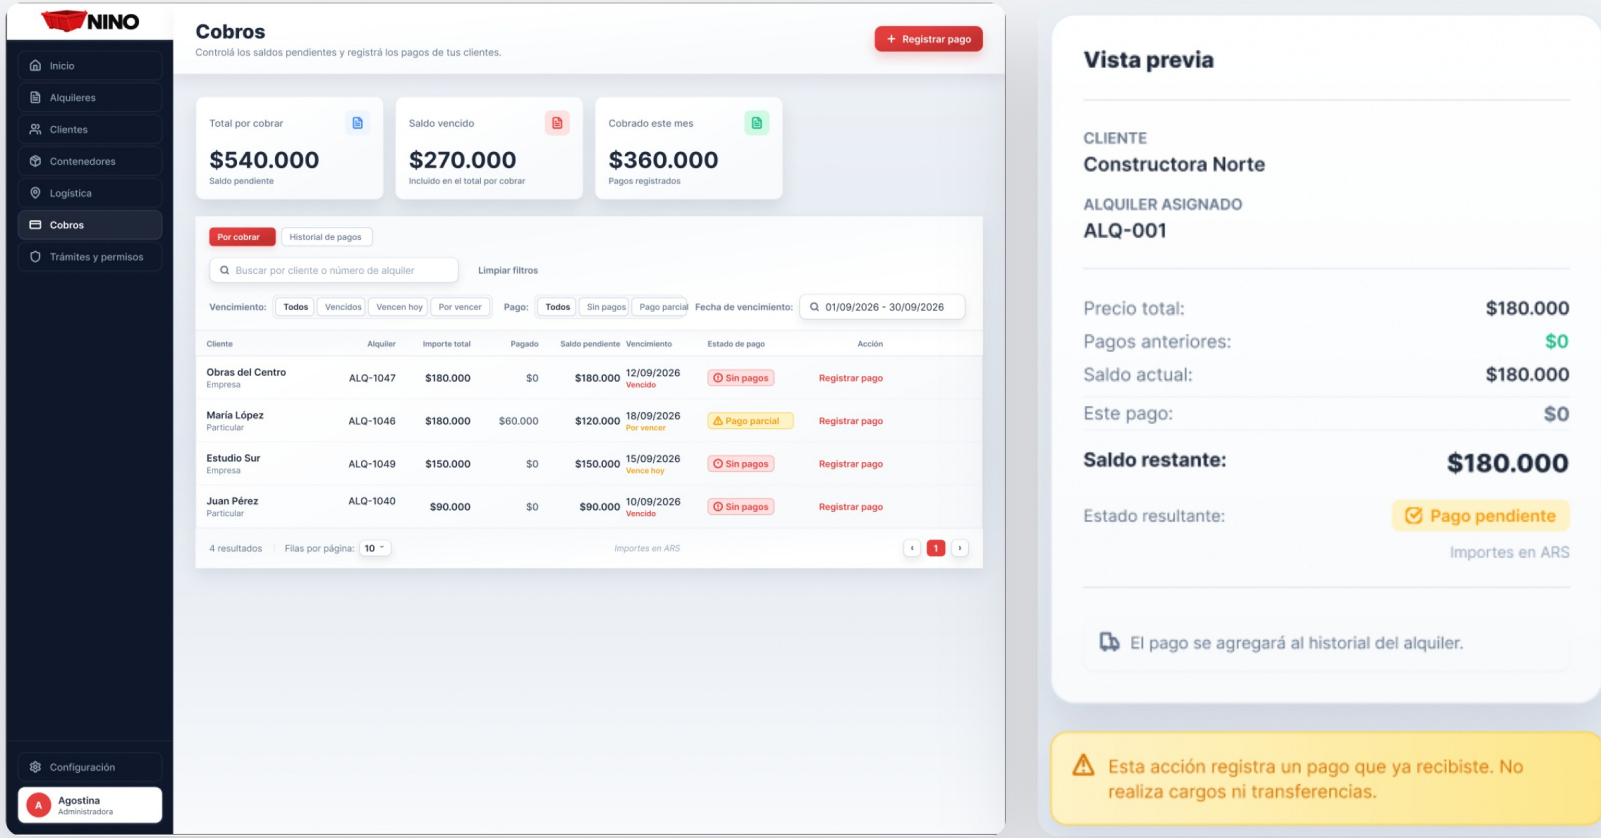

Every balance has a clear status

Overdue, due today and upcoming are kept apart.

Partial payments show what's still owed.

A preview shows the new balance, and makes clear nothing is charged.

Goal 02

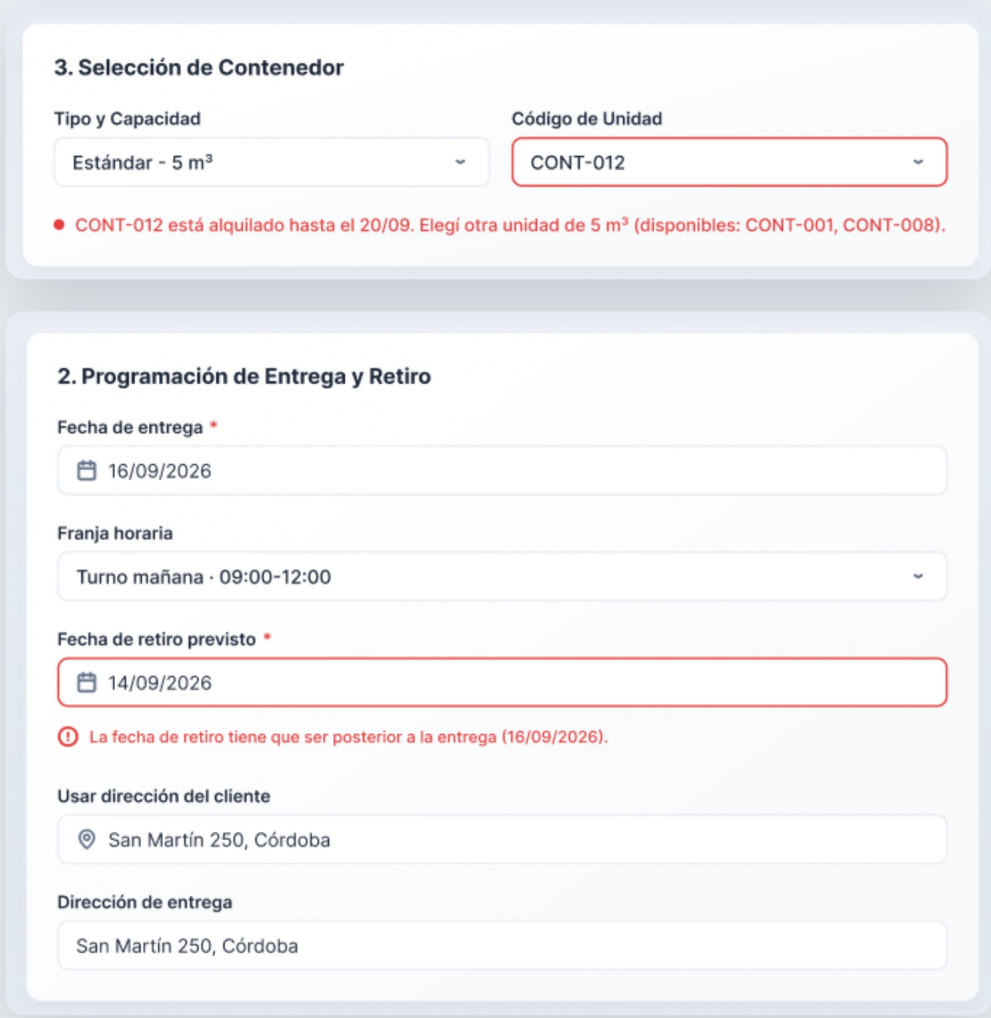

ERROR PREVENTION

Catch mistakes before they cost a trip

> A pickup set before the delivery is flagged, showing the delivery date.

> A container that's already out says until when, and suggests free ones.

> "Create rental" stays off until the problem is fixed.

WHAT'S NEXT

Test it with the two people who'll use it

USABILITY TEST

Both administrators create a rental, assign a truck and register a payment.

Watch for errors, hesitation, and whether they still copy notes on paper.

STILL OPEN

Truck tracking is a simulated preview: is sharing the route on WhatsApp enough, or do drivers need an app?

How to move existing customers out of the spreadsheet.
