UX/UI CASE STUDY · MOBILE APP

OneTap

An expense tracker built around one moment: logging a purchase before you forget it.

Research, UX, UI, testing | MVP | Live · English and Spanish

01 · THE PROBLEM

Expenses get logged late, or not at all

Most finance apps ask for several fields before you can save a single purchase. So people put it off, and by the time they sit down to log, they no longer remember what they spent.

Goal: make logging fast enough to do right at the moment of the purchase.

02 · BENCHMARK

Fast, plain, simple: no app had all three

	Monefy	Fintonic	Wallet	OneTap
Logging	Very fast	Automatic, less manual	2–3 steps	Log at the moment of purchase
Language	Simple, everyday	More technical	Clear but long	Plain, everyday words
Interface	Clean, visual	Balanced	More complex	Simple and direct

Desk research (BBVA, Clarín, El Cronista) pointed the same way: more people are replacing spreadsheets with expense apps.

03 · MVP SCOPE

Amount first. Everything else has a default.

I kept the first version to what's needed to log money in and out and see where it went. The date is set to now, so the only required inputs are the amount and a category.

1

Add expense or income

Keypad, category, date.

2

Categories

Nine, each with an icon.

3

Transactions

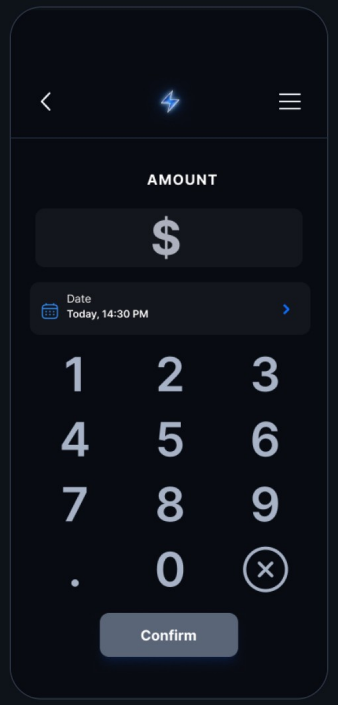

Search and filters.

4

Balance

Income vs. expenses by month.

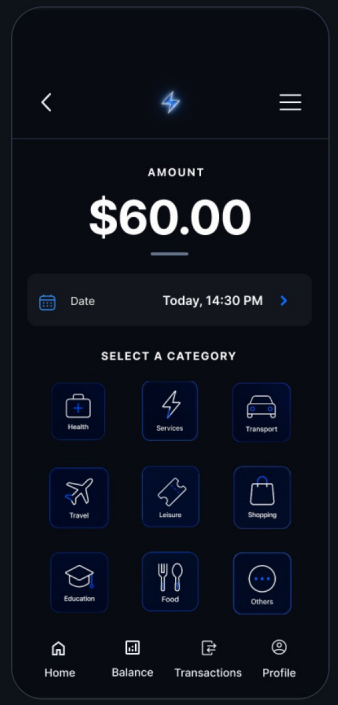

Logging an expense: amount, category, done

1

Type the amount

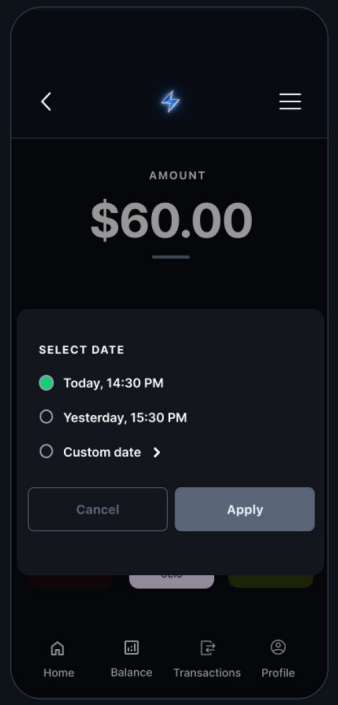

A large field and a full keypad, nothing else.

2

Pick a category

Nine icons in one grid, all visible without scrolling.

3

Date only if needed

Set to now. Today, yesterday or a custom date.

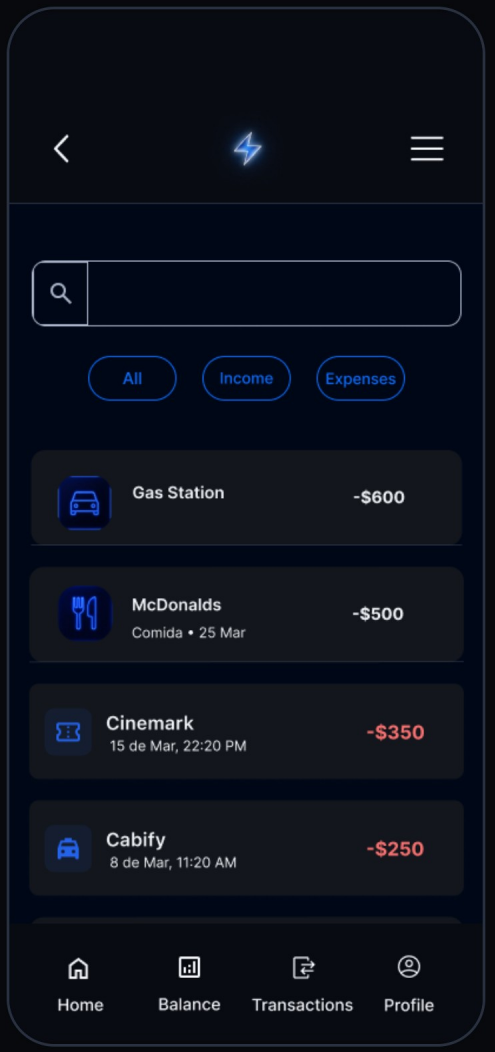

05 · TRANSACTIONS

Every expense, searchable and filtered

Every entry shows its category icon, name, date and amount. A search bar and three filters (All, Income, Expenses) narrow the list without leaving the screen.

Dark theme
One blue accent marks what you can tap.

Four-tab nav
Home, Balance, Transactions, Profile.

06 · USABILITY TEST

5 of 5 users logged an expense and an income

Task: open the app, register one expense and one income. Everyone completed both. These friction points still came up:

What I saw	What I changed
Transactions was hard to find	[Change]
The search bar didn't work	[Change]
The amount field didn't respond to taps	[Change]
Categories lacked detail	[Change]

5 participants. A heuristic review (Nielsen's 10) flagged one weak spot: error recovery.

07 · SHIPPED

Live on Vercel, in English and Spanish

The MVP is online and works in both languages, so it can be tried on any phone, not only as a Figma prototype.
