MAKING ENERGY SOFTWARE EASY TO UNDERSTAND

Landing page designed in Figma and built by me in React, plus the product's interfaces and component library.

Agostina Boris · Product Designer

01 · CONTEXT

THE ONLY DESIGNER IN AN EARLY-STAGE ENERGY COMPANY

Savergy builds software that measures, forecasts and coordinates a factory's energy assets to cut costs and free up grid capacity. I joined a small team with two senior developers.

LANDING PAGE

Designed in Figma and built solo in React + Vite.

PRODUCT

Flows, wireframes and high-fidelity screens.

SYSTEM

Component library and design guidelines.

Product screens are confidential; this case shows the public landing and my process.

02 · THE CHALLENGE

A TECHNICAL PRODUCT, EXPLAINED TO PEOPLE WHO PAY THE ENERGY BILL

Forecasting, peak shaving, batteries, grid limits. The landing had to turn all of that into a clear business case, and lead to one action: request a demo.

03 · STRUCTURE

OUTCOMES FIRST, TECHNOLOGY SECOND

Promise → Problem → Solution → How it works → Sectors → Contact

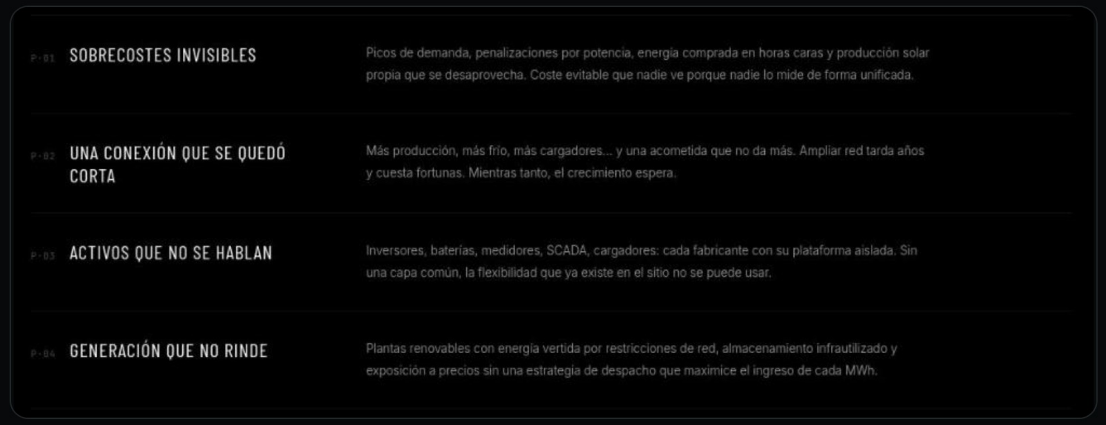

Right after the hero, four outcomes (lower cost, more capacity, coordinated assets, every kWh used) say what changes before explaining how.

04 · VISUAL LANGUAGE

DATA, NOT STOCK PHOTOS

A dark, control-room look with one teal accent. Small charts and numbers carry the message, the way the product itself does.

Condensed uppercase headlines for impact, a clean sans for reading, and repeated card and list patterns so long technical content stays scannable.

05 · SECTORS

SIX AUDIENCES, ONE PATTERN

Each sector card names the visitor's own problem in their words, with a tiny chart of what Savergy changes and the keywords they'd look for.

06 · TESTING BEFORE LAUNCH

EVERYONE GOT THROUGH. MOST FOUND THE FORM TOO LONG.

Test in Maze with 8 participants. Task: explore the landing and get in touch. Short survey afterwards.

8/8
completed the contact flow

6/8
said the form had too many fields

Change: I shortened the form. It now has five fields, and the message hint suggests what to include.

Participants were friends and acquaintances, not target buyers.

07 · FROM FIGMA TO PRODUCTION

DESIGNED IT, THEN BUILT IT

I took the landing from Figma prototype to a live, scroll-driven site in React and Vite, on my own. No handoff gap: what was designed is what shipped.

React + Vite
Coded from scratch

6 languages
ES, EN, DE, FR, IT, NL

Live

08 · INSIDE THE PRODUCT

DESIGNING SCREENS DEVELOPERS CAN BUILD AS DRAWN

END-TO-END INTERFACES

User flows, wireframes and high-fidelity screens, with empty, loading and error states.

COMPONENT LIBRARY

Components and guidelines in Figma, so new screens are assembled, not redrawn.

DEVELOPER-READY SPECS

States, responsive behavior and edge cases defined before handoff.

REVIEWS WITH THE CEO

Designs checked against business needs and technical implementation.

Product screens are confidential and not shown.

OUTCOME

THE DEVELOPERS NOW ASK FOR MY REVIEW BEFORE THEY BUILD

The landing is live, the product has a shared component library, and design is now part of how the team builds, not a step after it.
